The advantage of parquet floors on Elastilon
No glue, chipboard or nails

Front Cover Story

Elastilon is a strong elastic underlay that has an elastic one-sided adhesive layer. This specially formulated layer is protected by a plastic tear resistant foil. Parquet or solid wood should be installed square to the direction of the underlay, after which the protective plastic foil, that is between

the wood and elastic underlay, can be pulled out.

The wooden parts are now tightly and permanently joined to the underlay.

When shrinking or swelling of the floor occurs, there will be no visual seems or gaps.

- Tests in America and Denmark have pointed out that the elasticity of Elastilon is at least guaranteed for 70 years.
- The system is (thanks to its elasticity) extremely suitable for wood floors in combination with underfloor heating.
- Because Elastilon completely seals the underside of the wood floor against air, the boards will not cup anymore.
- In wet areas like bathrooms and saunas parquet can be installed.
